

Employee Tracking

what the system records, and the rules it enforces

A record of what people actually did – a recognition when someone does well, a goofup when something goes wrong – so a review conversation rests on dated entries instead of on whoever remembers loudest.

WRITTEN FOR MANAGEMENT AND EXECUTIVE ASSISTANTS

90 days ROLLING WINDOW. OLDER EVENTS DON'T COUNT	3 events MINIMUM BEFORE A SIGNAL IS SHOWN	1 · 2 · 3.5 · 6 IMPACT WEIGHTS LOW → CRITICAL	48 hours TO FIX YOUR OWN ENTRY YOURSELF	Invite only NO OPEN SIGN-UP, EVEN WITH GOOGLE

01 What this is

Every screen in the system is built from entries that someone typed in. Nothing is estimated, inferred or filled in.

If nobody recorded it, the system does not know it happened – and it will not pretend otherwise. That is the trade: you get a record you can defend in a review, but only for the things people took two minutes to write down.

THE ONE HABIT THAT MATTERS

Two minutes at the time beats an hour of recall at appraisal. An employee with no entries shows NO SIGNAL – that is not a good score, it means nobody has been watching.

02 Who can do what

Management and Executive Assistants both record performance, but they are not the same account. An EA records events and can fix their own for 48 hours. Changing the system itself, correcting someone else's entry, and reading the audit log stay with Super Admin and Management.

CAN THEY...	SUPER ADMIN & MD	EXEC ASSISTANT	HR	DEPT MANAGER	VIEWER
See every employee	Yes	Yes	Yes	Own dept	Own dept

CAN THEY...	SUPER ADMIN & MD	EXEC ASSISTANT	HR	DEPT MANAGER	VIEWER
Record performance	Yes	Yes	No	No	No
Fix their own entry, first 48 hours	Yes	Yes	—	—	—
Edit anyone's entry, any time	Yes	No	No	No	No
Delete an entry permanently	Yes	No	No	No	No
Add & edit employees	Yes	No	Yes	No	No
Manage who can sign in	Yes	No	No	No	No
Categories, observers, settings	Yes	No	No	No	No
See the full audit log	Yes	No	No	No	No
See one record's own history	Yes	Yes	Yes	Own dept	Own dept

ENFORCED IN THE DATABASE

A Department Manager does not merely have rows hidden on screen – the database refuses to return them. Another department's data cannot be reached by any route, including by calling the API directly.

03

The screens

Dashboard EVERYONE

What needs attention right now, for the date range you pick at the top right.

- **Four cards** – headcount, goofups, who needs attention, who was recognised.
- **Management Attention** – only people who need action. An empty list is genuinely good news.
- **Quick Insights** – each line pairs a number with what to do about it, and links straight to the filtered list.
- **Impact Mix** – how serious the recorded goofups are. Recognitions are not counted here; they carry no impact grade.
- **Issue heat** – weighted goofup load per person per month. Darker is heavier.

Lists always say how much they are hiding – *Showing 6 of 23* with a **Show all** button, never a silent top six.

Performance EVERYONE

The full ledger: every entry, searchable and filterable. This is where you go to check a specific claim.

- Filter by employee, department, type, category, impact or period. The impact filter disappears when you filter to positive contributions, because those carry no impact.
- **Saved views** keep a filter combination you use often.
- **Export CSV** gives you exactly the rows currently filtered – nothing more.
- Each row has a **:** menu: view, edit, archive, delete.

Reports EVERYONE

One employee, one period, formatted to print and sign. Covered in section 10.

Settings SUPER ADMIN & MD

- **Employee database** – add, edit, deactivate. *Edit rows* changes several people at once without opening a form; *Update emails* takes a pasted list rather than fifty forms.
- **Performance categories** – what people pick from when recording. Goofup categories carry a default impact; positive ones do not.
- **Observers** – the names offered under *Who observed this?* Kept separate from the employee database, because the people who witness events are usually not the people being assessed.
- **User access** – who can sign in, and as what.
- **Audit log** – every change, grouped by the record it happened to.
- **General** – the numbers behind the signal. Editable, but read the warning on that page first.

Employee profile EVERYONE

Click any name for their full timeline, recognitions and goofups shown separately, and the working behind their signal.

04

Recording an event

Press **Record Performance** – top right on desktop, the middle button in the bottom bar on a phone.

01 Pick the person

Type to search. Only active employees appear.

02 Positive contribution, or goofup

This decides which categories you are offered next – and whether you are asked for an impact at all.

03 Choose a category

Quality Issue, Delay, Teamwork, Leadership and so on. A goofup category arrives with a default impact, which you can override.

04 Set the impact – goofups only

Low, Medium, High or Critical. This is the single most consequential field on the form; the weights are in section 6. You will not see it on a positive contribution, because the scale grades how bad something was, which says nothing about a recognition.

05 Say who observed it

Optional, drawn from the Observers list in Settings. This is the person who saw it, which is often not the person typing it in – the recorder is stored separately and cannot be changed.

06 Write what happened, and save

One specific sentence. *“Delivered 4 days late”* is still useful in six months; *“poor performance”* is not.

TWO RULES YOU WILL MEET

You cannot record against yourself. Not even as Super Admin – the database refuses it.

You have 48 hours to fix your own entry. After that only Management can change it, so history cannot be quietly rewritten weeks later. Every change is logged either way.

Fixing an entry

Every row in the ledger carries a  menu on the right. It offers four actions and greys out the ones you cannot use, with the reason attached – so a missing option is never a mystery.

ACTION	WHAT HAPPENS	WHO
View	The full record – description, observer, recorder, attachments, and its own change history.	Anyone who can see the record
Edit	Title, description, date, category and impact. Employee, type and who recorded it are frozen at creation.	Management any time; the recorder for 48 hours
Archive	Asks for a reason. The record leaves the ledger and stops counting toward signals, but is kept and stays readable in the audit trail.	Management any time; the recorder for 48 hours
Delete	Gone permanently, along with its attachments. No confirmation step – it goes immediately.	Super Admin and MD only

ARCHIVE, UNLESS IT WAS NEVER REAL

Archive is the one you almost always want. It hides the record and keeps the history, so if the entry is ever questioned there is still something to produce.

Delete cannot be undone and fires on the first click. The deletion itself is written to the audit log with your name – so there is a record that a record was removed – but the entry is gone. Use it for something entered in error, not for something inconvenient.

How the signal works

Each employee gets one word:

STRONG	STABLE	WATCH	ATTENTION	NO SIGNAL
--------	--------	-------	-----------	-----------

It is *not* recognitions minus goofups. Three things shape it.

1. Impact is weighted

One critical goofup outweighs six low ones. These are the current weights:

IMPACT	WEIGHT	MEANING
Low	1	Minor, easily corrected
Medium	2	Noticeable, some rework
High	3.5	Real cost to the business
Critical	6	Serious – customer, safety or compliance

Those weights grade goofups only. A positive contribution carries no impact, so every recognition counts once – nobody can lift someone's band by grading a compliment “critical”.

2. Old events fade

An event keeps roughly half its weight after about a month (a 45-day decay). Something from last week matters more than the same thing from two months ago, and nothing older than **90 days** counts at all.

3. Silence is not a pass

Fewer than **three events** and the system says **NO SIGNAL** – never **STABLE**. Someone nobody has observed is a different problem from someone doing fine, and the system refuses to confuse the two.

07

Reading the bands

The rules are checked in this order. The first one that matches wins.

#	BAND	TRIGGERED WHEN
1	ATTENTION	Any critical goofup at all – checked before everything else, including the three-event minimum
2	NO SIGNAL	Fewer than 3 events in the window
3	ATTENTION	Weighted issue load reaches 7, or 2+ overdue follow-ups
4	WATCH	Issue load reaches 4, or the same category repeats, or the trend drops sharply
5	STRONG	Recognition load reaches 6, issues stay under 3, and the trend is not falling
6	STABLE	Issue load under 4 and nothing overdue

WHY RULE 1 SITS ABOVE RULE 2

A single critical goofup flags **ATTENTION** immediately, even for someone with only that one entry. Waiting for a third event before surfacing a safety or compliance failure would defeat the point of recording it.

Every badge explains itself. Hover it, or open the profile, and you get the sentence behind the verdict – how many events, what load, what trend. If it cannot be explained, it does not ship.

08

Adding people

A new employee to track

Settings → Employee database → Add employee.

Name, department, designation, who they report to, status, and an optional email. They appear in the record form immediately.

Someone who needs to sign in

Settings → User access → Give someone access.

Enter their Gmail address and pick a role.

INVITE ONLY – THIS IS THE IMPORTANT ONE

Signing in with Google does not grant access. Only people whose email has been added here can get in; everyone else is refused, however valid their Google account.

Their row shows PENDING until they sign in for the first time, then LINKED. Nothing is wrong while it says Pending.

Someone who witnesses events

Settings → Observers → Add observer. A name, and optionally a note such as *MD* or *Floor supervisor – Weaving*. Observers need no login and need not be employees.

To retire one, **deactivate rather than delete**: they leave the dropdown while every past record still shows who observed it. The system blocks deleting an observer that any record names.

09

Removing people

Two different actions. Pick the right one.

ACTION	WHAT HAPPENS	USE WHEN
Deactivate	Removed from the record form and the dashboard. All history kept and readable. Reversible.	Almost always – someone has left, or a login is no longer needed
Delete	Gone permanently. Cannot be undone.	Only for a row added by mistake

THE SYSTEM WILL STOP YOU

An employee with any recorded event **cannot be deleted**. Their history would be left with nobody attached to it, so the database refuses and offers Deactivate instead.

A user who has recorded events cannot be deleted either, for the same reason – their entries would lose their author. And you cannot delete your own login, so you cannot lock yourself out.

10

The MD report

Reports → pick the employee → set From and To → Download PDF.

One page: letterhead, the person, their signal, key figures, activity by month, every event in the period, and a signature block for Prepared / Reviewed / Approved. Print and CSV sit beside it.

SET THIS ONCE IN THE PRINT DIALOG

Tick **Background graphics**, or the tinted panels print white. Untick **Headers and footers** to drop the browser's date and URL. Chrome remembers both.

The employee dropdown lists only people with at least one recorded event – a report on someone with no entries would be a blank page.

The audit trail

Every change is written by the database itself, not by the app – so it is recorded even if a change is made outside this system. One save is one entry, however many fields it touched.

One record at a time

Open any event and scroll to *History*: created, edited, archived, restored – each with who, when, and every field that changed, old value to new. This is the fastest answer to “why does this entry say that?”

Everything at once

Settings → Audit log lists records, not individual changes. Open one to see its whole history in the same form. Search by record, by person or by type. Deleted records stay listed, marked *no longer exists* – that is the point of an audit trail.

WHAT IS NOT LOGGED

Housekeeping columns the system maintains itself, and saves that changed nothing. Open a record, change nothing, save – no entry is written.

What it won't do

These are deliberate. Knowing them saves you hunting for a setting that does not exist.

It won't guess	No estimated scores, no filled gaps. Fewer than three events shows NO SIGNAL .
It won't let you score yourself	No role can, including Super Admin.
It won't let history be quietly edited	48 hours for your own entry, Management beyond that, and every change logged. Management can delete an entry outright – and that deletion is logged too.
It won't orphan a record	Anyone with history cannot be deleted, only deactivated.
It won't grade a recognition	Impact applies to goofups; a positive contribution has none to give.
